	Index	21

This library offers an implementation of the `skosprovider.providers.VocabularyProvider` interface that uses an `RDFlib` graph as input.

1.1 Installation

To be able to use this library you need to have a modern version of Python installed.

This easiest way to install this library is through **pip** or **easy install**:

```
$ pip install skosprovider_rdf
```

This will download and install `skosprovider_rdf` and a few libraries it depends on.

1.2 Usage

This library offers an implementation of the `skosprovider.providers.VocabularyProvider` interface that uses an `rdflib.graph.Graph` as input. This provider can be used to add a *SKOS* vocabulary contained in an *RDF* file to your application. The provider itself does not read the *SKOS* file, but expects to be passed a *Graph*. So any type of RDF serialisation that can be read by `rdflib`, can be used with this provider.

```
import os

from rdflib import Graph

from skosprovider_rdf.providers import RDFProvider

graph = Graph()

file = os.path.join(os.path.dirname(__file__), '..', 'tests', 'data', 'simple_turtle_
↳products')
graph.parse(file, format="turtle")

provider = RDFProvider(
    {'id': 'PRODUCTS'},
```

(continues on next page)

(continued from previous page)

```

graph
)

print("provider.get_all()")
print("-----")
print(provider.get_all())
print("")

print("provider.find({'label': 'jewelry'})")
print("-----")
print(provider.find({'label': 'jewelry'}))
print("")

print("provider.get_by_id('http://www.products.com/Jewellery')")
print("-----")
print(provider.get_by_id('http://www.products.com/Jewellery'))
print("")

print("provider.get_by_uri('http://www.products.com/Jewellery')")
print("-----")
print(provider.get_by_uri('http://www.products.com/Jewellery'))
print("")

```

Out of the box `skosprovider_rdf` assumes your *RDF* file contains exactly one conceptscheme. If no conceptscheme is found in the file and you did not pass one to the provider through the `concept_scheme` parameter, a new conceptscheme is automatically created. If more than one conceptscheme is present in the file, you can again specify the conceptscheme through the `concept_scheme` parameter (passing a `skosprovider.skos.ConceptScheme`) or you can pass the uri of one of the conceptschemes present in the `concept_scheme_uri` parameter. When you specify a conceptscheme like this, only the concepts linked to this scheme through *skos:inScheme* statements will be loaded.

```

'''
This examples fetches only one conceptscheme from a turtle file containing two.
'''

import os

from rdflib import Graph

from skosprovider_rdf.providers import RDFProvider

graph = Graph()

file = os.path.join(os.path.dirname(__file__), '..', 'tests', 'data', 'waarde_en_
↳besluit_types.ttl')
graph.parse(file, format="turtle")

provider = RDFProvider(
    {'id': 'WAARDETYPES'},
    graph,
    concept_scheme_uri = 'https://id.erfgoed.net/thesauri/waardetypes'
)

print("provider.get_all()")
print("-----")
print(provider.get_all())

```

(continues on next page)

(continued from previous page)

```

print("")

print("provider.find({'label': 'esthetische waarde'})")
print("-----")
print(provider.find({'label': 'esthetische waarde'}))
print("")

print("provider.get_by_id(46)")
print("-----")
print(provider.get_by_id('46'))
print("")

print("provider.get_by_uri('https://id.erfgoed.net/thesauri/waardetypes/46')")
print("-----")
print(provider.get_by_uri('https://id.erfgoed.net/thesauri/waardetypes/46'))
print("")

```

It also provides a utility function to dump any implementation of `skosprovider.providers.VocabularyProvider` to a `rdflib.graph.Graph`. Again, since the provider only deals with the `Graph` object, it's possible to serialise a `VocabularyProvider` to whatever RDF serialisations `rdflib` allows.

```

'''
This script demonstrates dumping a
:class:`skosprovider.providers.SimpleCsvProvider` as a RDF Graph. In this
case, `n3` serialisation is used, other serialisations are available through
:mod:`rdflib`.
'''

import os
import csv

from skosprovider.providers import SimpleCsvProvider
from skosprovider.uri import UriPatternGenerator
from skosprovider.skos import ConceptScheme, Label, Note, Source
from skosprovider_rdf.utils import rdf_dumper

ifile = open(
    os.path.join(os.path.dirname(__file__), 'data', 'menu.csv'))

reader = csv.reader(ifile)

csvprovider = SimpleCsvProvider(
    {'id': 'MENU'},
    reader,
    uri_generator=UriPatternGenerator('http://id.python.org/menu/%s'),
    concept_scheme=ConceptScheme(
        uri='http://id.python.org/menu',
        labels=[
            Label(type='prefLabel', language='en', label='A pythonesque menu.')
        ],
        notes=[
            Note(

```

(continues on next page)

(continued from previous page)

```
        type='changeNote',
        language='en',
        note="<strong>We didn't need no change notes when I was younger.</
↪strong>",
        markup='HTML'
    )
],
sources=[
    Source("Monthy Python's Flying Circus, 1970. Spam.")
]
)
)

graph = rdf_dumper(csvprovider)

print(graph.serialize(format='n3'))
```

CHAPTER 2

Development

skosprovider_rdf is being developed by the [Flanders Heritage Agency](#).

Since we place a lot of importance of code quality, we expect to have a good amount of code coverage present and run frequent unit tests. All commits and pull requests will be tested with [Travis-ci](#). Code coverage is being monitored with [Coveralls](#).

Locally you can run unit tests by using [pytest](#) or [tox](#). Running pytest manually is good for running a distinct set of unit tests. For a full test run, tox is preferred since this can run the unit tests against multiple versions of python.

```
# Setup for development
$ python setup.py develop
# Run unit tests for all environments
$ tox
# No coverage
$ py.test
# Coverage
$ py.test --cov skosprovider_rdf --cov-report term-missing tests
# Only run a subset of the tests
$ py.test skosprovider_rdf/tests/test_providers.py
```

Please provide new unit tests to maintain 100% coverage. If you send us a pull request and this build doesn't function, please correct the issue at hand or let us know why it's not working.

3.1 Providers module

This module contains an `RDFProvider`, an implementation of the `skosprovider.providers.VocabularyProvider` interface that uses a `rdflib.graph.Graph` as input.

class `skosprovider_rdf.providers.RDFProvider` (*metadata, graph, **kwargs*)

Should the provider only take concepts into account explicitly linked to the conceptscheme?

check_in_scheme = **False**

A simple vocabulary provider that use an `rdflib.graph.Graph` as input. The provider expects a RDF graph with elements that represent the SKOS concepts and collections.

Please be aware that this provider needs to load the entire graph in memory.

to_text (*data*)

data of binary type or literal type that needs to be converted to text. :param data :return: text representation of the data

3.2 Utils module

This module contains utility functions for dealing with skos providers.

`skosprovider_rdf.utils.rdf_c_dumper` (*provider, c*)

Dump one concept or collection from a provider to a format that can be passed to a `skosprovider.providers.RDFProvider`.

Parameters

- **provider** (`skosprovider.providers.VocabularyProvider`) – The provider that wil be turned into an `rdflib.graph.Graph`.
- **c** (`String`) – identifier

Return type `rdflib.graph.Graph`

`skosprovider_rdf.utils.rdf_conceptscheme_dumper(provider)`

Dump all information of the conceptscheme of a provider to a format that can be passed to a `skosprovider.providers.RDFProvider`.

Parameters `provider` (`skosprovider.providers.VocabularyProvider`) – The provider that will be turned into an `rdflib.graph.Graph`.

Return type `rdflib.graph.Graph`

`skosprovider_rdf.utils.rdf_dumper(provider)`

Dump a provider to a format that can be passed to a `skosprovider.providers.RDFProvider`.

Parameters `provider` (`skosprovider.providers.VocabularyProvider`) – The provider that will be turned into an `rdflib.graph.Graph`.

Return type `rdflib.graph.Graph`

`skosprovider_rdf.utils.text_(s, encoding='latin-1', errors='strict')`

If `s` is an instance of bytes, return `s.decode(encoding, errors)`, otherwise return `s`

4.1 1.3.0 (15-12-2022)

- Don't export local id as `dterms.identifier` when it's equal to the URI (#117)
- Add formal support for Python 3.10 and Python 3.11 (#120)

4.2 1.2.0 (11-10-2022)

- Better RDF rendering for concepts part of a collection (#104)

4.3 1.1.0 (17-08-2022)

- Drop python 3.6 and 3.7 support, add support for 3.8, 3.9 and 3.10
- Update RDFLib to 6.2.0

4.4 1.0.0 (17-12-2021)

- Drop python 2 support
- Upgrade all requirements (#90)

4.5 0.8.1 (27-07-2020)

- Cleaner handling of *infer_concept_relations*. When exporting through `skosprovider_rdf` this attribute will determine if broader/narrower relations between concepts are generated when there's a collection between them, as

is the case when a concept has a guide term dividing the underlying concepts. When reading from an RDF file, the *infer_concept_relations* attribute will be set to True if at least one concept in a collection under a concept has a broader relation with said concept. (#73)

- Prevent the `_add_labels` method from generating an error. (#80)

4.6 0.8.0 (08-06-2020)

- Update to RDFlib 0.5.0 (#74)

4.7 0.7.0 (12-02-2020)

- Compatible with [SkosProvider 0.7.0](#).
- Make it possible to read an RDF file containing more than one conceptscheme. (#35)
- Drop support for Python 3.3, 3.4 and 3.5. This is the last version that will support Python 2. (#63)

4.8 0.6.0 (16-07-2017)

- Compatible with [SkosProvider 0.6.1](#).
- Add information about the `void.Dataset` when dumping to RDF.

4.9 0.5.0 (11-08-2016)

- Compatible with [SkosProvider 0.6.0](#).
- Add official python 3.5 compatibility.
- Add support for sources when dumping to RDF and reading from RDF. (#17)
- Add support for languages to conceptschemes when dumping to and reading from RDF. (#16)
- Add support for HTML in SKOS notes and sources. (#15, #20)

4.10 0.4.1 (17-07-2015)

- RDF dump: Add the top concepts and the conceptscheme identifier in the full RDF dump (equal to the RDF conceptscheme dump).
- RDF provider: literal and binary type to text when parsing the graph to a list.

4.11 0.4.0 (03-03-2015)

- Allow dumping a single conceptscheme to RDF. This does not dump the entire conceptscheme with all it's concepts or collections, just information on the conceptscheme itself and it's top concepts.

- Allow dumping a single concept or collection to RDF, and not just an entire conceptscheme with all concepts or collections.
- Add skos:inScheme information to RDF dumps.
- Better handling of dc(t):identifier. When reading an RDF file both dcterms:identifier and dc:identifier are considered when analysing the identifier. During dumping, we also dump to dcterms:identifier.

4.12 0.3.0 (19-12-2014)

- Compatible with [SkosProvider 0.5.0](#).
- Dumping to an RDF file now also dumps information on the Conceptscheme.
- Dumping to an RDF file now also adds notes to a Collection, not just to a Concept.
- Now handles subordinate_array and superordinate concept.

4.13 0.2.0 (14-10-2014)

- Add support for Dublin Core identifier (#5)

4.14 0.1.3 (02-09-2014)

- Fix a namespace error for SKOS Notes. (#2)

4.15 0.1.2 (31-07-2014)

- Documentation fixes and cleanup
- Removed RDFlib artefacts from output.

4.16 0.1.1 (20-05-2014)

- Bugfixing
- encoding/decoding problems
- casting rdf subjects and objects to rdflib URI's
- Added tests

4.17 0.1.0

- Initial version

RDF *Resource Description Framework*. A very flexible model for data definition organised around *triples*. These triples forms a directed, labeled graph, where the edges represent the named link between two resources, represented by the graph nodes.

SKOS *Simple Knowledge Organization System*. An general specification for Knowledge Organisation Systems (thesauri, word lists, authority files, ...) that is commonly serialised as *RDF*.

URI A *Uniform Resource Identifier*.

URN A URN is a specific form of a *URI*.
